Lucas-Interpretation Language Interpreter Dialogue Summary

Conclusions Programmers Students

## Students' View

### Demonstration

Summary: Students require these services for learning ...

- Check user input automatically, flexibly and reliably: Input establishes a *proof situation* (for *automated* proving) with respect to the logical context
- give explanations on request by learners: All underlying mathematics knowledge is transparent due to the "LCF-paradigm" in Isabelle
- oppose a next step if learners get stuck: "next-step-guidance" due to Lucas-Interpretation.

## Students' View

### Demonstration

Summary: Students require these services for learning ...

Check user input automatically, flexibly and reliably:

Input establishes a *proof situation* (for *automated* proving) with respect to the logical context

give explanations on request by learners: All underlying mathematics knowledge is transparent due to the "LCF-paradigm" in Isabelle

oppose a next step if learners get stuck: "next-step-guidance" due to Lucas-Interpretation.

### LUCAS-Interpretation Language Interpreter Dialogue Summary

Conclusions Programmers Students

### Lucas-Interpretation is a novel contribution, which

## 1 interprets a functional language

- "purely functional" no input / output: interaction  $\longrightarrow \text{Pt.3}$
- programmer concerned with mathematics only
- TODO: embed into Isabelle's function package

### controls input / output as side-effects

- regards tactics as "break points" (like debugger)
- hands over control at tactics  $\longrightarrow$  Pt.3

### delegates user-interaction to a Dialogue Module:

- "dialogue authoring" by respective experts (DialogRules)
- adaptive to courses
- adaptive to individual students UserModel

## Summary

Programmers Students

## **Usability for Programmers**

## Programming in $\mathcal{ISAC}$

- becomes comparable with Mathematica/Maple/... if *ISAC* adopts Isabelle's function package
- is embedded into mechanising mathematics, i.e.
  - development of theories (definitions, laws, ...)
  - development of libraries of specifications
  - development of verified Computer Algebra
- is separated from users' interaction: interaction is a side-effect managed by Lucas-Interpretation

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

- mathematicians focus mathematics
- interaction is covered by dialogue authors

User's View Programmers Students

- Lucas-Interpretation Language Interpreter Dialogue Summary
- Conclusions Programmers Students

## Self-explaning system ...

- $\dots$  while step-wise applying a method (**solving**)
  - during trial & error learning:
    - feedback on input steps (formula | tactic)
    - <next> step by system, if got stuck
    - "next-step guidance" by dialogue component:
      - suggest next step partially
      - suggest next steps for selection
      - auto-complete partial input
  - in changing levels of abstraction:
    - formal justification for each formula
    - justification = meta-, formula = object-language
    - another "meta-level": instructions in program
    - ...

 $\ldots$  while modelling and specifying an engineering problem:  $\longrightarrow$  another talk
