This work ...

... aims to evaluate of CoqHammer over some theories accompanying Concrete Semantics book.

- 1 reformalization of such theories in Coq,
- 2 run CoqHammer on goals, and test if we can achieve a similar brevity of the formal text in comparison with the original text.

CoqHammer: the overview

We have ...

... reproven approximately 100 theorems from

- Star, AExp, BExp, ASM, Com, Big_Step, Hoare, Small_Step, Compiler and Compiler2

Isabelle/HOL theories in Coq, using CoqHammer calls and some Ltac based decision procedures.

An example

Lemma `strengthen_pre`: $\forall (P P' Q: \text{assn}) c,$
 $(\text{entails } P' P) \rightarrow \text{hoaret } P c Q \rightarrow \text{hoaret } P' c Q.$

Proof.

`hobvious Empty (@conseq) (@entails)`

Qed.

lemma `strengthen-pre`:

$\llbracket \forall s. P s \rightarrow P s; \vdash_t \{P\} c \{Q\} \rrbracket \implies \vdash_t \{P\} c \{Q\}$

by `(metis conseq)`

Benchs & Conclusion

	# of lines	# of words	# of tactics	# of hammer calls	time (secs)
Isabelle/HOL	2806	11278	544	-	31
Coq	3493	19292	1190	468	149

The number of Coq tactics we used to get the same lemmas proven is almost twice in number, as opposed to Isabelle/HOL, but about half of which benefits from the automation techniques that CoqHammer comes with.

Thank you for your attention!
